Q1. (a) Fall	se
(b) Tr	ne .
(G) Tr	we
(d) Fal	se
Q2. (a) Th	e state space are 4 locations with or without dirt.
So	the size of state space is $4\times2^4=64$
	reachable states
(W]	draw the search tree in the next page.
	the true, we define the actions as & left(L), right(R), up(U), down(D), suck(S)
(d) Ye	s, because depth-first search with graph search doesn't allow repeated states
Dep	th-first search is complete for finite state spaces.

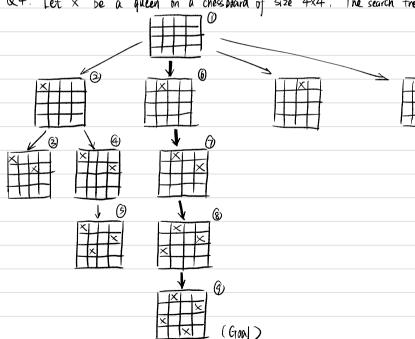

Q3 (a) Let Li (Ri, Ui, Di) be moving the i-th tile to the left (right, up, down), i \(\) [1,14]. So the set of action is: ELI, RI, UI, DI,

12, R2, U2, D2,

LI4, RI4, UI4. DI4?

(b) If two blank positions are different, the size of state space is 16. However, we need to remove repeated states because two blank positions are same. The size of repeated state space is: $\frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 15 \times \cdots \times 1 = \frac{1}{2} \times 16 \times 0 = \frac$ As a result, the size of state space is: $(16!) - \frac{1}{3} \times (16!) = \frac{1}{3} \times (16!)$

Q4. Let "x" be a queen on a chess board of size 4x4. The search tree is:

Q5 The search tree is:
